*Highlights*

United Nations  
New York, 2019

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which States Members of the United Nations draw to review common problems and take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and, through technical assistance, helps build national capacities.

The Population Division of the Department of Economic and Social Affairs provides the international community with timely and accessible population data and analysis of population trends and development outcomes for all countries and areas of the world. To this end, the Division undertakes regular studies of population size and characteristics and of all three components of population change (fertility, mortality and migration). Founded in 1946, the Population Division provides substantive support on population and development issues to the United Nations General Assembly, the Economic and Social Council and the Commission on Population and Development. It also leads or participates in various interagency coordination mechanisms of the United Nations system. The work of the Division also contributes to strengthening the capacity of Member States to monitor population trends and to address current and emerging population issues.

## **Notes**

The designations employed in this report and the material presented in it do not imply the expression of any opinions whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term "country" as used in this report also refers, as appropriate, to territories or areas.

This report is available in electronic format on the Division's website at [www.unpopulation.org](http://www.unpopulation.org). For further information about this report, please contact the Population Division, Department of Economic and Social Affairs, United Nations, Two United Nations Plaza, DC2-1950, New York, 10017, USA; phone: +1 212-963-3209; email: [population@un.org](mailto:population@un.org).

# What Is Urbanization?

Urbanization is a complex socio-economic process that transforms the built environment, converting formerly rural into urban settlements, while also shifting the spatial distribution of a population from rural to urban areas. It includes changes in dominant occupations, lifestyle, culture and behaviour, and thus alters the demographic and social structure of both urban and rural areas. A major consequence of urbanization is a rise in the number, land area and population size of urban settlements and in the number and share of urban residents compared to rural dwellers.

Urbanization is shaped by spatial and urban planning as well as by public and private investments in buildings and infrastructure. An increasing share of economic activity and innovation becomes concentrated in cities, and cities develop as hubs for the flow of transport, trade and information. Cities also become places where public and private services of the highest quality are available and where basic services are often more accessible than in rural areas.

The degree or level of urbanization is typically expressed as the percentage of population residing in urban areas, defined according to criteria used by national governments for distinguishing between urban and rural areas (see box 3 for the definitions used in this report). In practice, urbanization refers both to the increase in the percentage of population residing in urban areas and to the associated growth in the number of urban dwellers, in the size of cities and in the total area occupied by urban settlements.

# World Urbanization Prospects 2018:

## Key Facts

- Urban growth is closely related to the three dimensions of sustainable development: social, economic, and environmental. Well-managed urbanization, informed by an understanding of population trends over the long run, can help to maximize the benefits of high levels of density while minimizing environmental degradation and other potential adverse impacts of a growing number of city dwellers.
- To ensure that the benefits of urbanization are shared and that no one is left behind, policies to manage urban growth need to ensure access to infrastructure and social services for all, focusing on the needs of the urban poor and other vulnerable groups for housing, education, health care, decent work and a safe environment.
- Globally, more people live in urban areas than in rural areas, with 55 per cent of the world's population residing in urban areas in 2018. In 1950, 30 per cent of the world's population was urban, and by 2050, 68 per cent of the world's population is projected to be urban.
- Today, the most urbanized regions include Northern America (with 82 per cent of its population living in urban areas in 2018), Latin America and the Caribbean (81 per cent), Europe (74 per cent) and Oceania (68 per cent). The level of urbanization in Asia is now approximating 50 per cent. Meanwhile, Africa remains mostly rural, with 43 per cent of its population living in urban areas.
- The rural population of the world has grown slowly since 1950 and is expected to reach its peak in a few years. The global rural population is now close to 3.4 billion and is expected to rise slightly and then decline to around 3.1 billion in 2050. Africa and Asia are home to nearly 90 per cent of the world's rural population. India has the largest rural population (893 million), followed by China (578 million).
- The urban population of the world has grown rapidly since 1950, having increased from 751 million to 4.2 billion in 2018. Asia, despite being less urbanized than most other regions today, is home to 54 per cent of the world's urban population, followed by Europe and Africa (13 per cent each).
- Growth in the urban population is driven by an overall population increase and by the upward shift in the percentage living in urban areas. Together, these two factors are projected to add 2.5 billion to the world's urban population by 2050, with almost 90 per cent of this growth happening in Asia and Africa.
- Just three countries – India, China and Nigeria – are expected to account for 35 per cent of the growth in the world's urban population between 2018 and 2050. India is projected to add 416 million urban dwellers, China 255 million and Nigeria 189 million.
- Close to half of the world's urban dwellers reside in settlements with fewer than 500,000 inhabitants, while around one in eight live in 33 megacities with more than 10 million inhabitants. By 2030, the world is projected to have 43 megacities, most of them in developing regions.
- Tokyo is the world's largest city with an agglomeration of 37 million inhabitants, followed by Delhi with 29 million, Shanghai with 26 million, and Mexico City and São Paulo, each with around 22 million inhabitants. Cairo, Mumbai, Beijing and Dhaka all have close to 20 million inhabitants.
- Some cities have experienced population decline in recent years. Most of these are located in the low-fertility countries of Asia and Europe where overall population sizes are stagnant or declining. Also, economic contraction and natural disasters have contributed to population losses in some cities.
- As the world continues to urbanize, sustainable development depends increasingly on the successful management of urban growth, especially in low-income and lower-middle-income countries where the most rapid urbanization is expected between now and 2050. Integrated policies to improve the lives of both urban and rural dwellers are needed, strengthening the linkages between urban and rural areas and building on their existing economic, social and environmental ties.

**Box 1. Data and methods\***

In preparing estimates and projections of the urban population, the United Nations mostly relies on data from national sources, including data reported to the UN Demographic Yearbook, reflecting varying definitions and criteria established by national authorities both for the level of urbanization, expressed as the percentage urban, and for the population size of cities. United Nations estimates and projections of the urban population of a country are based on officially reported trends of the proportion of the population living in urban areas. The quality of the resulting data depends on the quality of the information used as inputs. Such information normally consists of complete counts of both the total population residing in a country and the population living in urban areas. Censuses or population registers are the most common sources of such counts.

The future trend in the proportion urban is derived from a projection of the urban-rural growth differential. It is assumed that the most recently observed urban-rural growth difference for a given country (between two consecutive censuses) will follow a linear trend in the future, until it reaches an expected global urban-rural growth difference over a period of 25 years.

The method used for projecting city populations is similar. A city's growth rate between the two most recent censuses is assumed to change linearly until reaching an expected value determined by the city's current population size and the growth rate of the urban population for the country as a whole.

For all countries and areas, the proportion of the population living in urban areas was estimated and projected in single-year intervals for the period from 1950 to 2050. The size of the urban population for each year was obtained by multiplying the estimated proportion urban at the national level by an estimate or projection of the total population of the country or area as contained in World Population Prospects: The 2017 Revision (United Nations, 2017). Estimates and projections for countries and areas were aggregated to obtain corresponding figures for geographic regions and subregions, and for the world as a whole.

\* For additional details, please see United Nations (2018b).

# Introduction and Policy Implications

**The future of the world's population is urban.<sup>1</sup>** With more than half of the world's people living in urban areas, urbanization determines the spatial distribution of the world's population and is one of the four demographic mega-trends, with the growth of the global population, population ageing, and international migration. Estimates and projections of urbanization introduced in this report indicate that the future growth of the human population can be accounted for almost entirely by a growing number of city dwellers. By mid-century, roughly two thirds of the world's population will be living in urban areas. In many regions, the share of population living in cities, as well as the number and size of cities, will continue to grow, driven by a combination of factors, including a surplus of births over deaths in urban areas, migration from rural to urban areas and from abroad as well as the urbanization of formerly rural areas. Urbanization is also transforming the lives of those living in the rural areas around cities. Cities are major gateways and destinations for internal and international migrants and migration needs to be integrated into the strategic planning and management of cities and urban systems.

**Urbanization is closely related to the three dimensions of sustainable development: economic, social and environmental.** Well-managed urbanization (among other factors), informed by an understanding of population trends over the long run, can help to maximize the benefits of agglomeration while minimizing environmental degradation and other potential adverse impacts of a growing number of city dwellers, especially in low-income and lower-middle-income countries where the most rapid urbanization is expected between now and 2050. Unplanned or inadequately managed urban expansion, in combination with unsustainable production and consumption

patterns and a lack of capacity of public institutions to manage urbanization, can impair sustainability due to urban sprawl, pollution and environmental degradation. In recognition of their economic, social and environmental interdependence, the linkages that cities and small towns establish with surrounding rural areas should be strengthened. They can facilitate sustainable development in both urban and rural areas by delivering services and infrastructure improvements and expanding opportunities for off-farm employment to rural dwellers.<sup>2</sup> Planning for the delivery of services to urban and rural dwellers should include consideration of different scenarios for the future growth of urban centres and surrounding rural settlements.

**Urbanization has generally been a positive force for economic growth, poverty reduction and human development.** Cities are places where entrepreneurship and technological innovation can thrive, thanks to a diverse and well-educated labour force and a high concentration of businesses. Urban areas also serve as hubs for development, where the proximity of commerce, government and transportation provide the infrastructure necessary for sharing knowledge and information. Urban dwellers are often younger, more literate and more highly educated, are more likely to have access to decent work, adequate housing and social services, and can enjoy enhanced opportunities for cultural and political participation as well as gender equality. Economies of scale in urban areas and technological innovation can facilitate the sustainable provision of infrastructure such as roads, piped water and electricity, as well as basic services such as education

1. The Commission on Population and Development addressed urbanization in its 51st session and took note of the report of the Secretary General on World Demographic Trends (E/CN.9/2018/5). The thematic report of the Secretary General on Sustainable Cities, Human Mobility and International Migration (E/CN.9/2018/2) contains further policy recommendations.

2. See also the New Urban Agenda, adopted in October 2016 at the United Nations Conference on Housing and Sustainable Urban Development (Habitat III) and endorsed by the General Assembly in December 2016 (A/RES/71/256\*). The 2018 World Urban Forum (WUF9) organized by UN-Habitat in Kuala Lumpur, in February 2018, focused on the implementation of the New Urban Agenda and mobilized urban actors in national governments, subnational and local governments, civil society, private sector and academia to share knowledge and solutions for sustainable urban development; facilitate stakeholders' inputs to monitoring and reporting on the New Urban Agenda and facilitate strong multi-stakeholder partnerships.

and health care, all of which are essential to achieve the Sustainable Development Goals for the 2030 Agenda for Sustainable Development (United Nations 2015).

**Government policies for planning and managing sustainable urban growth can help ensure that the benefits of urbanization are shared equitably.** Sustainable Development Goal 11 is a commitment to making cities inclusive, safe, resilient and sustainable, and participatory planning can play an important role in the implementation. Policies that aim to restrict rural-to-urban migration are generally ineffective at forestalling city growth and can even result in economic, social and environmental harm. Sustainable urbanization requires that cities generate adequate income and decent employment opportunities; provide the necessary infrastructure for water and sanitation, energy, transportation and communication; ensure equitable access to housing and services; minimize the number of people living in slums; and preserve a healthy environment within the city and surrounding areas. To ensure that the benefits of urbanization are shared and that no one is left behind, policies to manage the urban growth need to consider the needs of women, including for equal access to services, property rights and political participation; youth, including policies to provide education and employment; older persons, including policies to promote healthy ageing; persons with disabilities, including policies and laws on accessible housing, public infrastructure, and transport; and focus on the urban poor and other vulnerable groups, including indigenous peoples. Fulfilling their needs allows them to play a positive economic, social, cultural role, etc. in urbanization and is a powerful tool to manage sustainable urbanization.

**Data on global trends in urbanization and city growth are critical for evidence-based policy making and planning.<sup>3</sup>** The availability of high quality, accessible, timely and reliable demographic data is essential for planning and implementing the 2030 Agenda for Sustainable Development. Improvements in civil registration and health

3. See also the report of the Secretary General on Actions for the further implementation of the Programme of Action of the International Conference on Population and Development: monitoring of population programmes, focusing on sustainable cities, human mobility and international migration (E/CN.9/2018/3).

information systems, alternative sources of information such as “big data”, the use of remote-sensing and satellite imagery and georeferencing as a standard practice of data collection, and broad participation in the 2020 round of censuses are essential elements to broaden evidence on urbanization. Assessing current and future needs with respect to urban growth and for setting policy priorities to promote inclusive and equitable urban and rural development should be based on up-to-date and coherent population estimates and projections. In order to systematically track levels and trends in urbanization around the world, contributing to the evidence base on urbanization, the Population Division of the Department of Economic and Social Affairs of the United Nations has issued for several decades revised and updated estimates and projections of the urban and rural populations of all countries in the world and of their major urban settlements.

**This report presents the highlights of the 2018 revision of *World Urbanization Prospects*.<sup>4</sup>** The dataset of the *World Urbanization Prospects* contains the latest estimates of the urban and rural populations of 233 countries or areas from 1950 to 2018 and projections to 2050, as well as estimates of population size from 1950 to 2018 and projections to 2035 for all urban settlements with 300,000 inhabitants or more in 2018. The annex tables in these Highlights provide data on the estimated and projected urban and rural populations, the percentage of the population that lives in urban areas and the average annual rate of change of the percentage urban for 233 countries or areas of the world. The tables also show the rank and annual growth rate of urban agglomerations with 5 million inhabitants or more in 2018, while focussing on the time-frame 1990–2030.

4. The full report, descriptions of the data, methodology, and complete data tables representing all countries and areas, geographic regions and subregions, income groups, development groups, and periods are available at <https://esa.un.org/unpd/wup/>.

# Trends in Urbanization

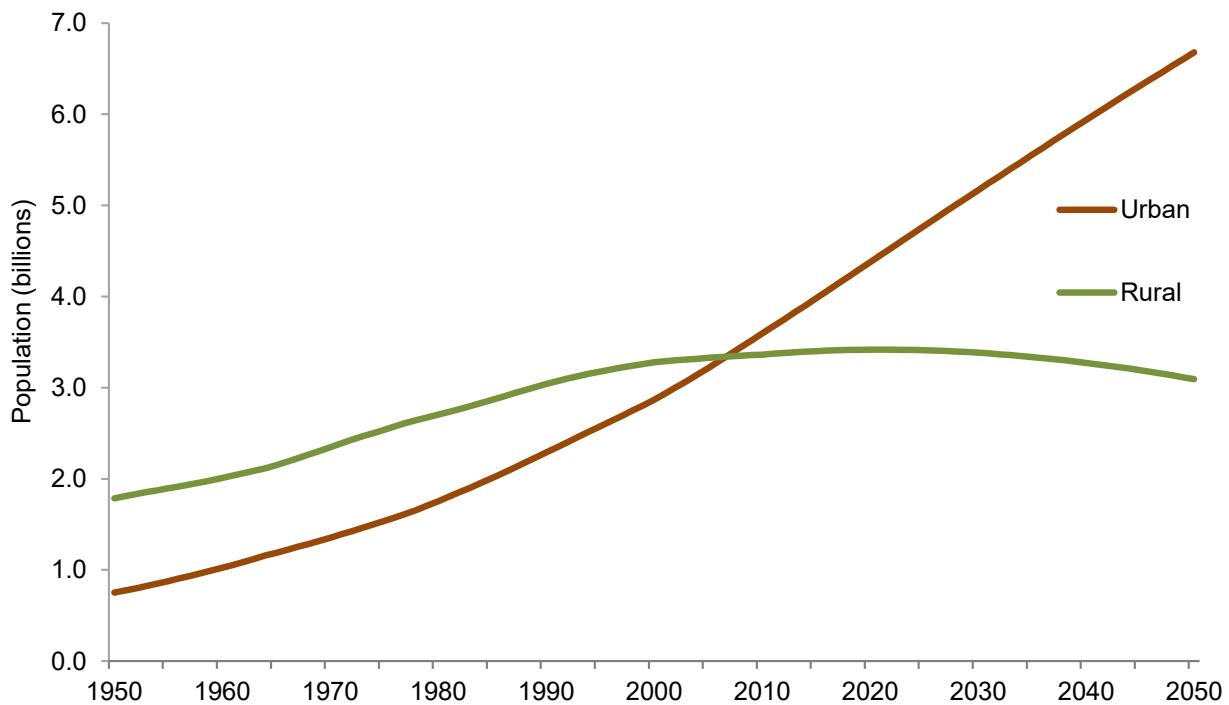

**Globally, more people live in urban areas than in rural areas today.** In 2018, 55 per cent of the world's population resided in urban areas. Overall, 4.2 billion people resided in urban settlements compared to 3.4 billion in rural areas.

**The world's population has gone through a process of rapid urbanization since 1950.** In 1950, more than two thirds (70 per cent) of people worldwide lived in rural settlements. In 2007, for the first time in history, the global urban population exceeded the global rural population, and since then the number of the world's city dwellers has continued to grow faster than the rural population (figure 1). Towards the end of the Agenda for Sustainable Development in 2030, the share of the world's population living in urban areas is expected to reach 60 per cent. It is projected that by 2050, the world will be more than two thirds urban (68 per cent), roughly the reverse

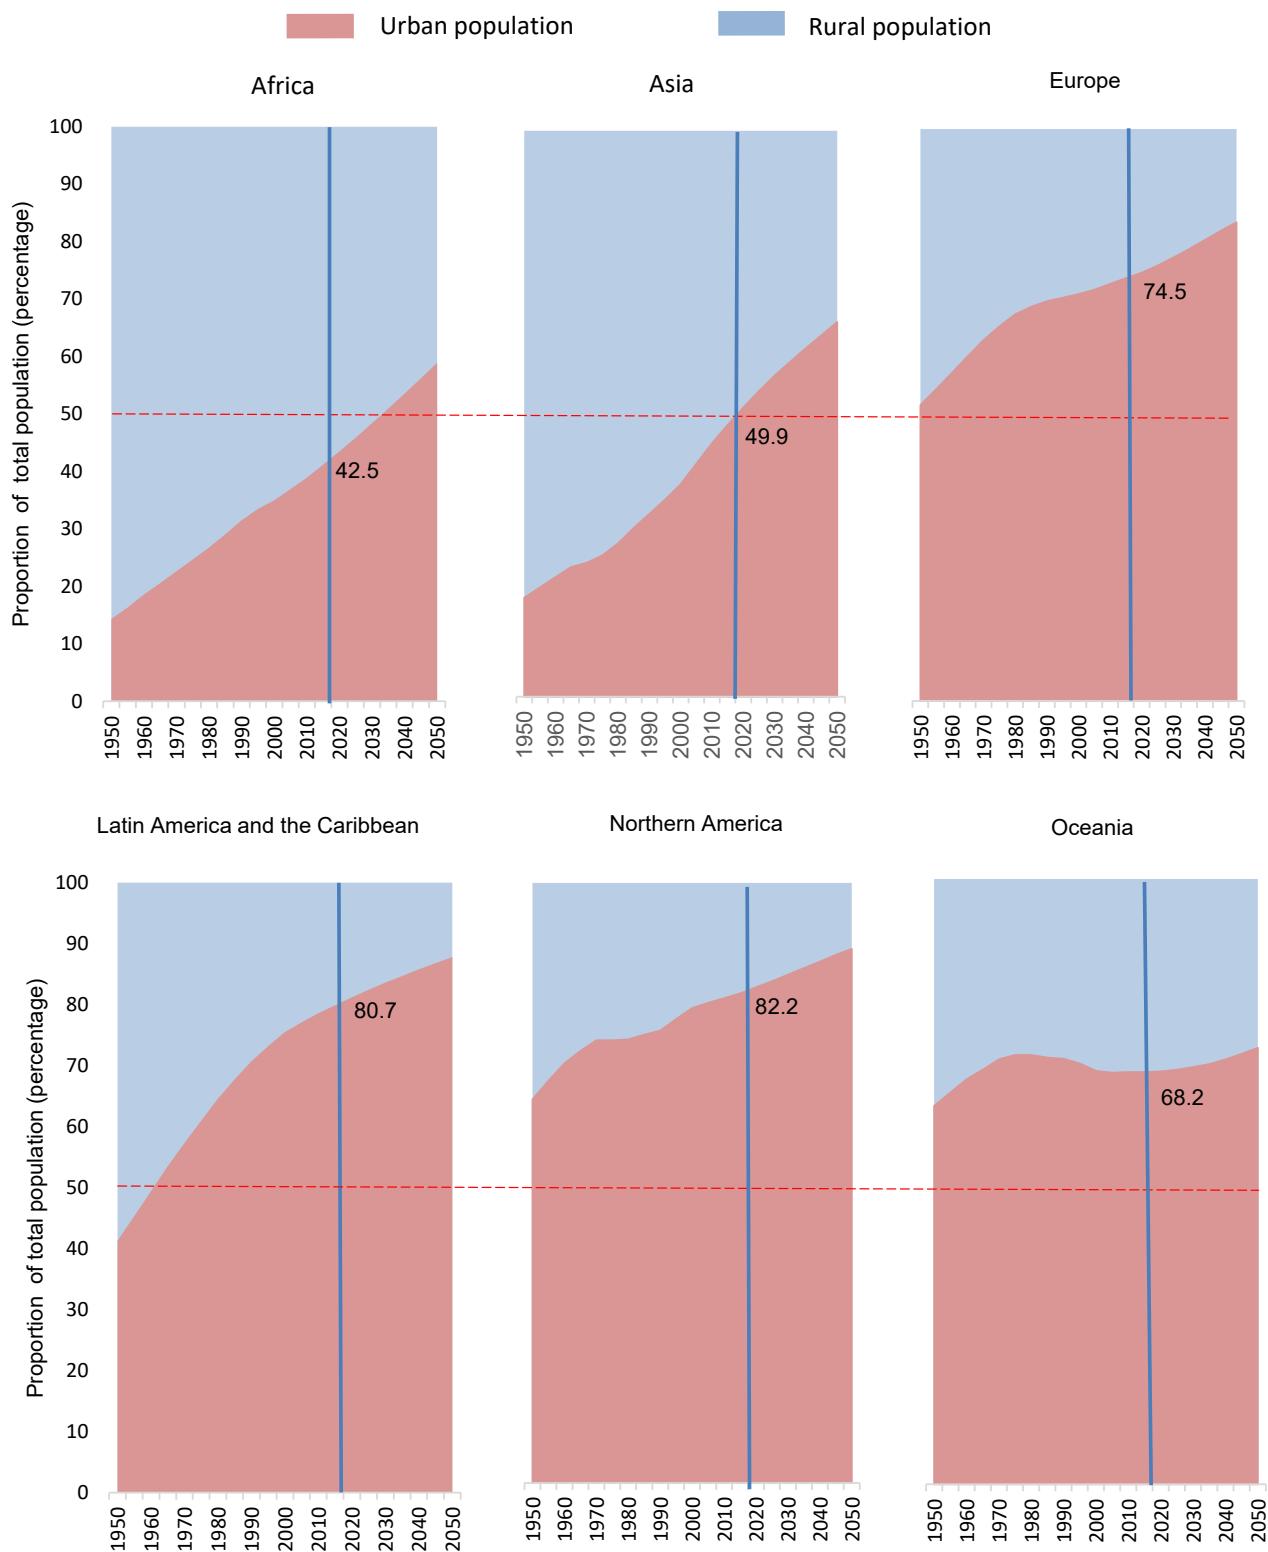

of the global rural-urban population distribution of the mid-twentieth century (also see annex table I).

**Over the coming decades, the level of urbanization is expected to increase in all regions, but with considerable variation.** Latin America and the Caribbean, and Northern America have been highly urbanized, with over 80 per cent of their population estimated to be urban in 2018 and a projected percentage of nearly 90 per cent in 2050. Europe, with nearly three quarters of its population living in urban areas in 2018, is expected to reach 80 per cent urban in 2040 and nearly 85 per cent by 2050 (figure 2). Meanwhile, Oceania is expected to have an almost stable percentage urban, rising from nearly 70 per cent today to slightly over 70 per cent in 2050.

**Figure 1. Urban and rural populations of the world, 1950-2050**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

**Figure 2. Urban and rural population as proportion of total population, by geographic region, 1950-2050**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

Africa, in contrast, remains mostly rural, with just over 40 per cent of its population living in urban areas in 2018, while Asia is now approximating 50 per cent. The percentages urban for Africa and Asia are projected to reach 59 and 66 per cent urban by mid-century, respectively.

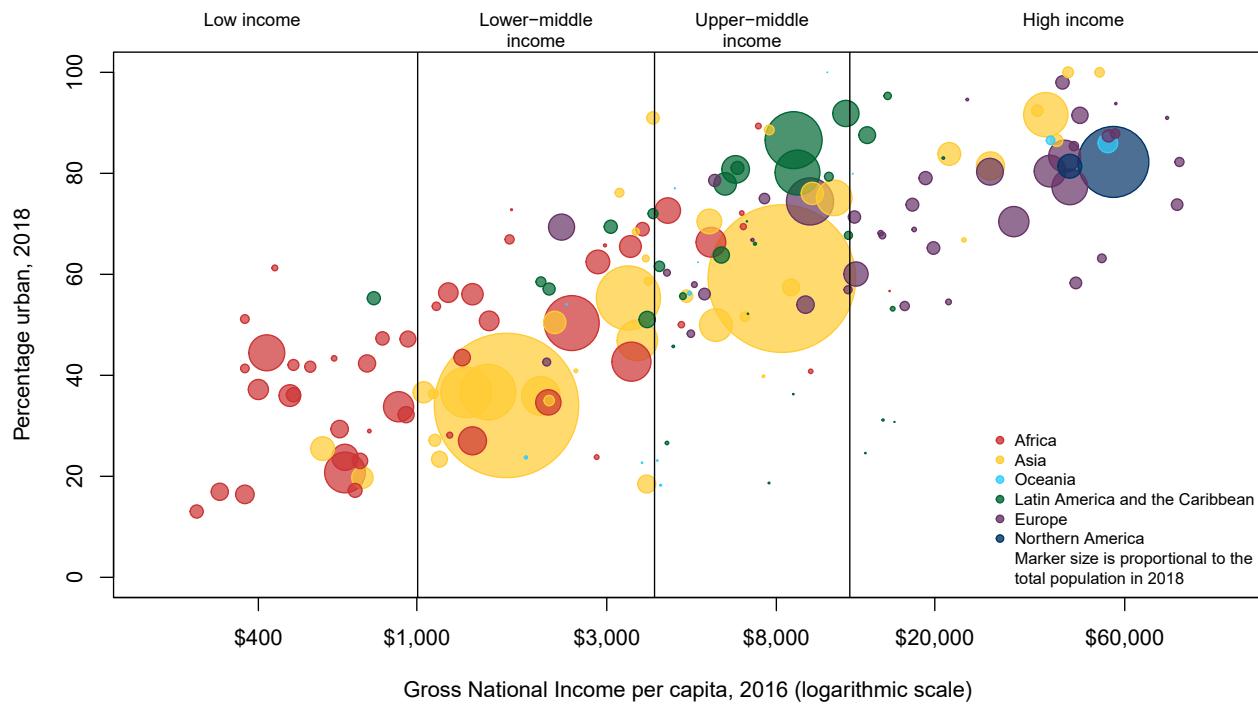

**Africa and Asia are urbanizing more rapidly than other regions of the world.** The rate of urbanization, measured as the average annual rate of change of the percentage urban, is the highest in Asia and Africa. These two regions are urbanizing faster with the proportion urban increasing by 1.3 and 1.1 per cent annually between 2015 and 2020, respectively, while regions that already have relatively high levels of urbanization are urbanizing at a slower pace, at less than 0.3 per cent annually during the same period (see annex table II).

**Both the levels and paces of urbanization differ considerably across income groups.** Most high-income countries of today have relatively high levels of urbanization, such as Australia, Canada, Japan, the United States of America, and most countries in Europe (figure 3). Many upper-middle-income countries, such as Brazil, China, Iran and Mexico, have experienced both rapid urbanization and rapid growth of gross national income, with levels of urbanization close to those in high-income countries. These countries have gained hundreds of millions of people living in urban areas across the world during recent decades, together with many lower-middle-income countries, such as India, Indonesia and Ethiopia, at lower levels of urbanization. On the other hand, a significant number of low-income countries in Africa still have low levels of urbanization.

In 1950, nearly 60 per cent of the population in high-income countries already lived in urban areas, and this share is expected to rise further, from 80 per cent today to nearly 90 per cent in 2050. By contrast, in the upper-middle-income countries of today, the percentage of population living in urban areas was just over 20 per cent in 1950. However, upper-middle-income countries have experienced a relatively fast pace of urbanization since 1950, and the share of urban population is expected to rise from two thirds today to over 80 per cent urban by 2050. Therefore, the gap between high-

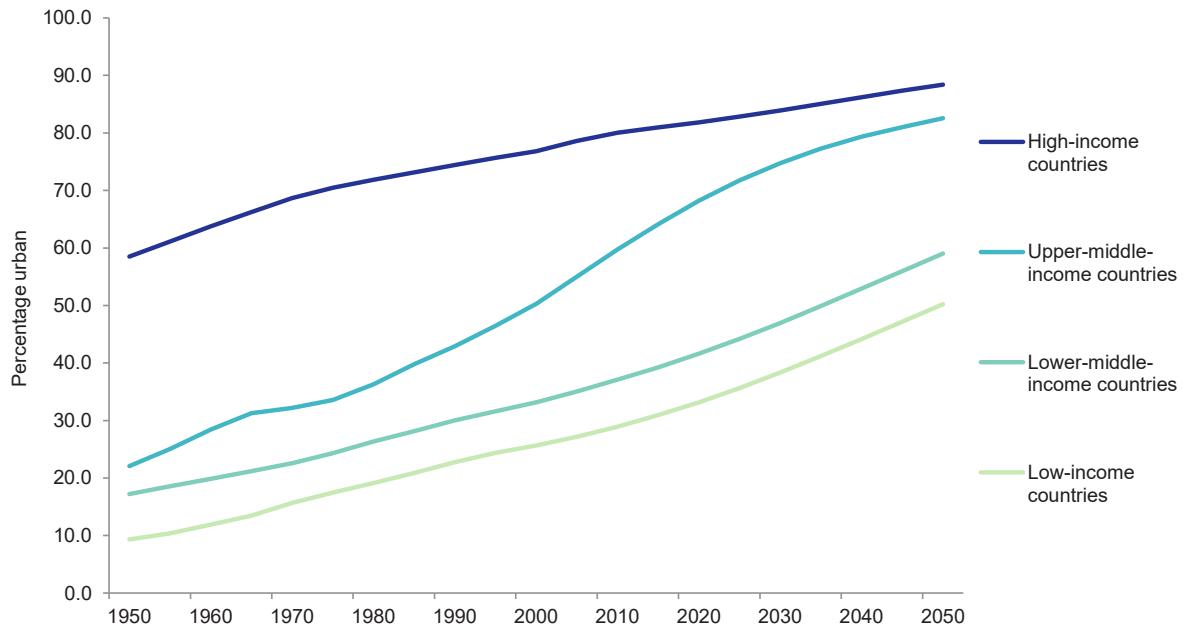

income and upper-middle income countries in the percentage urban has been closed significantly and it is projected that the difference between both groups of countries will continue to decline till 2050 (figure 4). In the lower-middle-income and low-income countries, the increase in the percentage urban has been lower in the past than in the upper-middle income countries. The respective shares of their populations living in urban areas are 41 and 32 per cent in 2018. Nevertheless, both groups of countries are expected to experience a higher pace of urbanization than others in the coming decades. By 2050, lower-middle and low-income countries are expected to have, on average, just under 60 per cent and over 50 per cent of their population residing in urban areas, respectively.

**Urbanization also differs considerably between countries.** In 2018, fourteen countries or areas still have low levels of urbanization, with less than 20 per cent of their population residing in urban areas. The largest among them, with a population of 10 million inhabitants or more, include Burundi, Malawi, Niger, Rwanda and South Sudan in Africa, Nepal and Sri Lanka in Asia, and Papua New Guinea in Oceania (see map 1). By 2050, these countries are expected to become significantly more urbanized, with some countries more than doubling their respective shares of urban population in 2018. In contrast, the proportion urban is already above 80 per cent in 65 countries. Among those with a population of at least 10 million inhabitants, the most highly urbanized countries are Belgium (98 per cent), Japan, Argentina and the Netherlands (all 92 per cent). By 2050, 101 countries are expected to have more than 80 per cent of their population reside in urban areas. The largest differences in the levels of urbanization today are found between countries in Africa and Asia. When interpreting the differences in levels of urbanization across countries, it is important to keep in mind the heterogeneity of the urban definition across countries. Differences across regions also apply to the spatial distribution of megacities with more than 10 million inhabitants in 2018. Today, most megacities are located in Asia (20), followed by Latin America and the Caribbean (6) and two or three in each of the remaining regions (see also section on cities).

**Figure 3. Percentage of population residing in urban areas by income group and country, 2018**

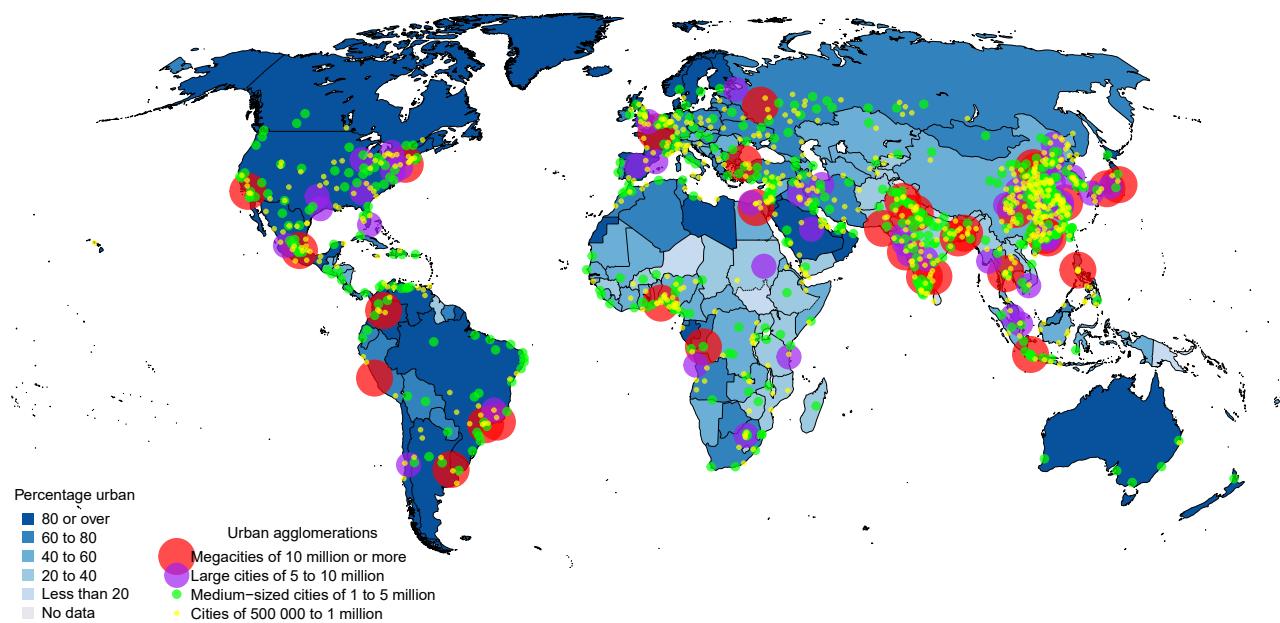

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

Note: The country classification by income level is based on 2016 GNI per capita from the World Bank.

**Figure 4. Percentage of population residing in urban areas by income group, 1950-2050**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

Note: The country classification by income level is based on 2016 GNI per capita from the World Bank.

**Map 1. Percentage urban and urban agglomerations with 500,000 inhabitants or more, 2018**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

The designations employed and the presentation of material on this map do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted line represents approximately the Line of Control in Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been agreed upon by the parties. Final boundary between the Republic of Sudan and the Republic of South Sudan has not yet been determined. A dispute exists between the Governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

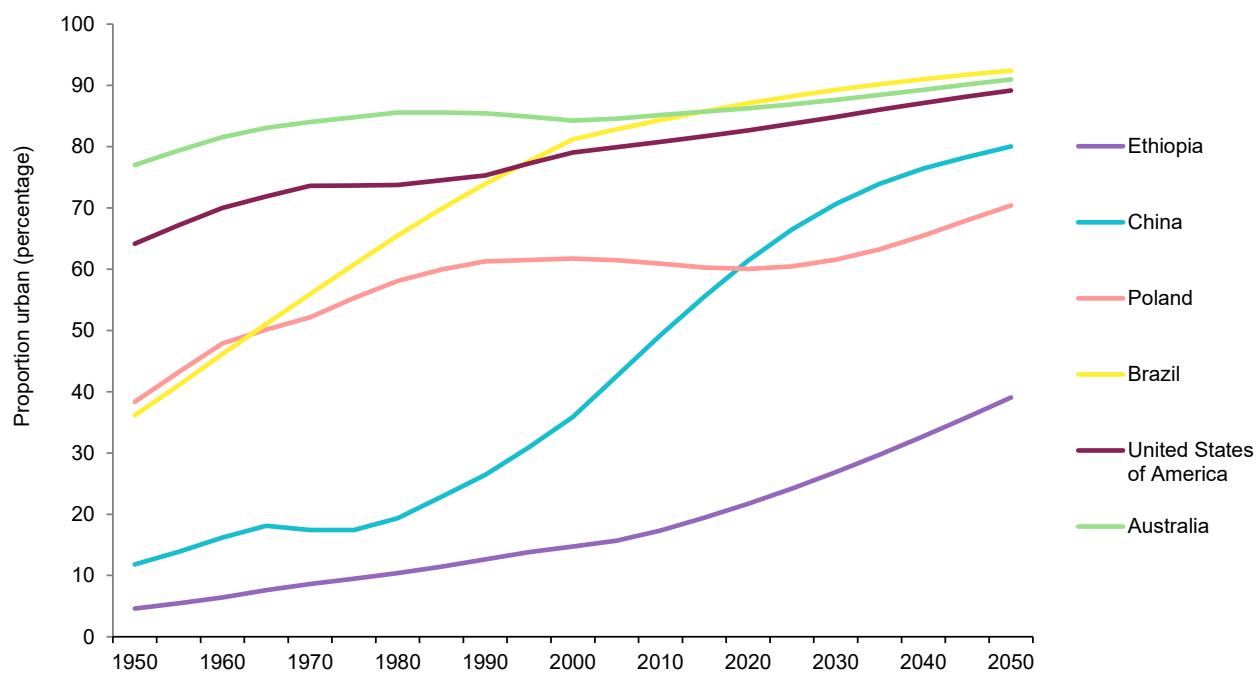

In Asia, China has experienced rapid urbanization since the late 1970s. In 1980, its proportion of urban population was about one fifth, lower than the average levels of Asia (just over one quarter). However, this percentage has increased rapidly to nearly 60 per cent in 2018 and is projected to rise to over 70 per cent in 2030 and further to 80 per cent by mid-century. In Africa, the level of urbanization in Ethiopia has been very low until now, with its proportion urban just over one fifth in 2018. Nonetheless, in the coming decades, its share of the population living in urban settlements is projected to almost double, to just under 40 per cent in 2050 (figure 5). For already highly urbanized countries in Latin America and the Caribbean, Northern America, Europe and Oceania, the pace of urbanization has slowed down in recent years. For example, Australia, the United Kingdom and the United States of America have over 80 per cent

of their population living in urban areas in 2018. Their respective urban shares are projected to experience only slight increases between 2018 and 2050. Brazil, on the other hand, at a similar level of urbanization today, has experienced a different trend, with a rapid urbanization process during the past decades that has slowed down in recent years. Like other highly urbanized countries, Brazil is projected to experience only slight increases in the percentage urban. Some countries in Eastern Europe, partly due to a combination of low fertility and emigration, are projected to experience a fairly slow urbanization process. For example, the percentage of the population living in urban areas in Poland, which had reached 60 per cent in 1990, is still 60 per cent today, and is expected to increase to just over 70 per cent by 2050.

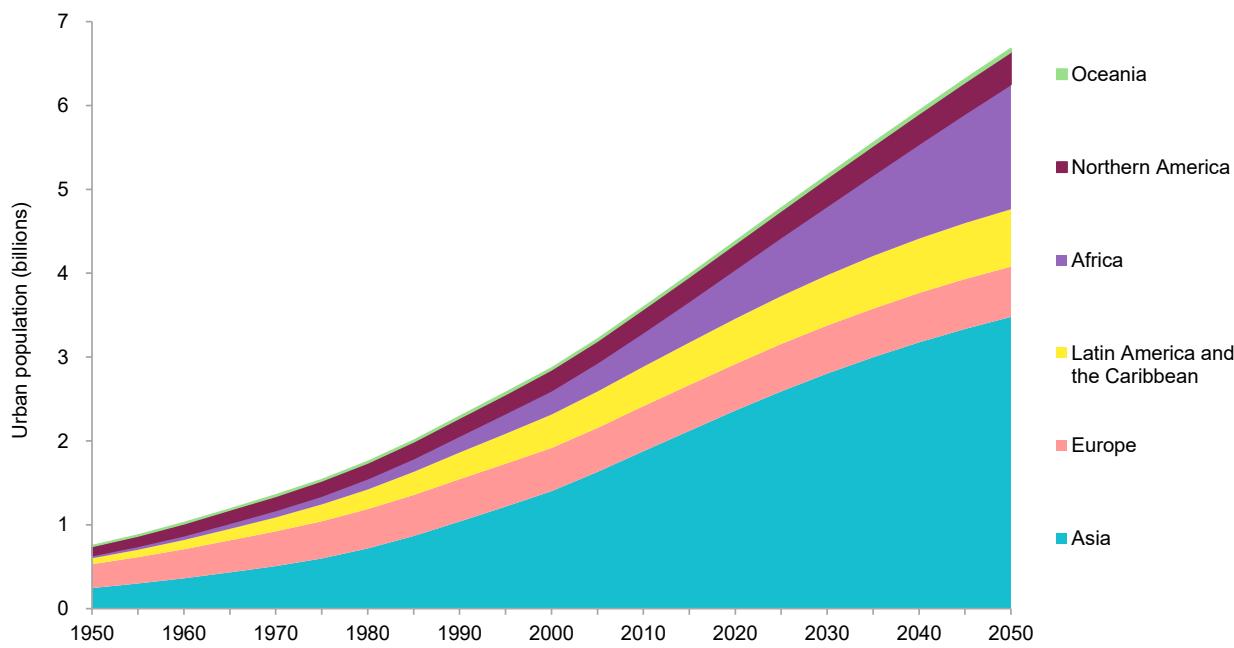

The continuing urbanization and overall growth of the world's population is projected to add 2.5 billion people to the urban population by 2050, with almost 90 per cent of this growth happening in Asia and Africa (figure 6a). Asia will continue to host over half of the world's urban population, while Africa's share is projected to increase by over 70 per cent (from about 13 per cent in 2018 to 22 per cent in 2050). The world's urban population is now close to 4.2 billion and is expected to reach 6.7 billion in 2050. Asia, despite its lower level of urbanization, is today home to about 54 per cent of the urban

population in the world. Europe, Africa and Latin America and the Caribbean all have similar shares of the world's urban population, with about 12 or 13 per cent each (figure 6b). Over the next three decades, Africa and Asia will experience a marked increase in their urban populations. By mid-century, the urban population of Africa is likely to almost triple and that of Asia to increase by more than half. As a consequence, most of the urban population of the world will be concentrated in Asia (52 per cent) and Africa (22 per cent) in 2050.

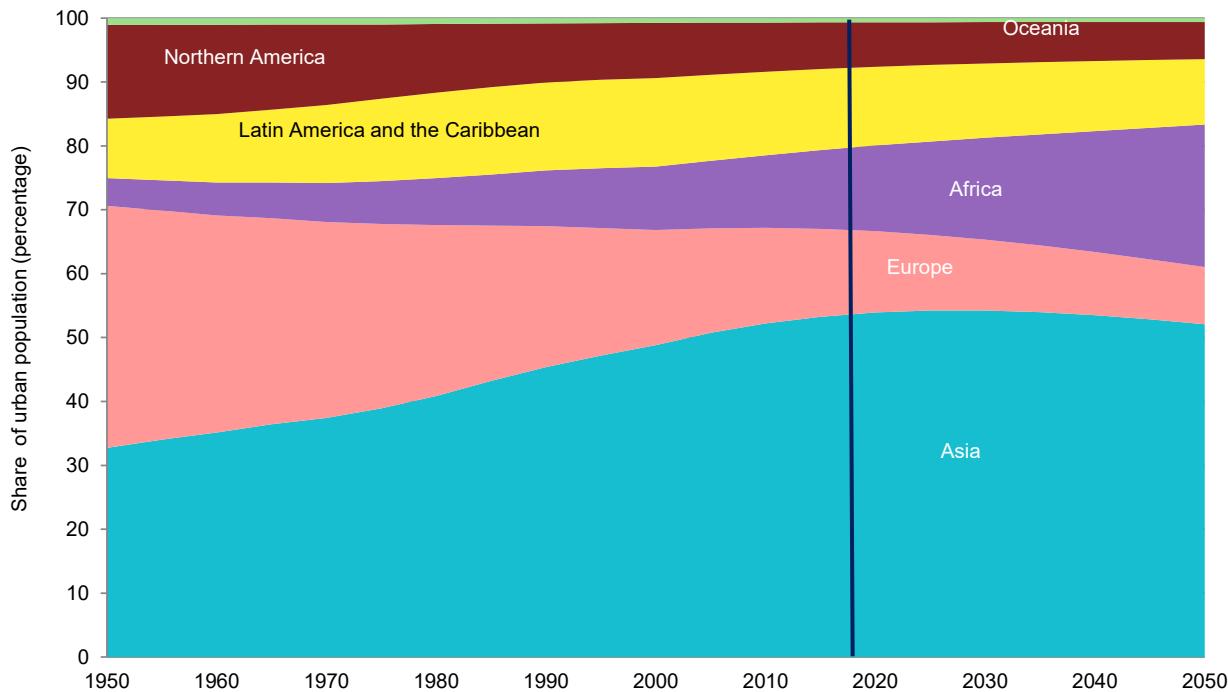

**Figure 5. Percentage of population residing in urban areas for selected countries, 1950-2050**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

**Figures 6a. Urban population of the world by geographic region, 1950-2050**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

**Figures 6b. Share of urban population of the world by geographic region, 1950-2050**

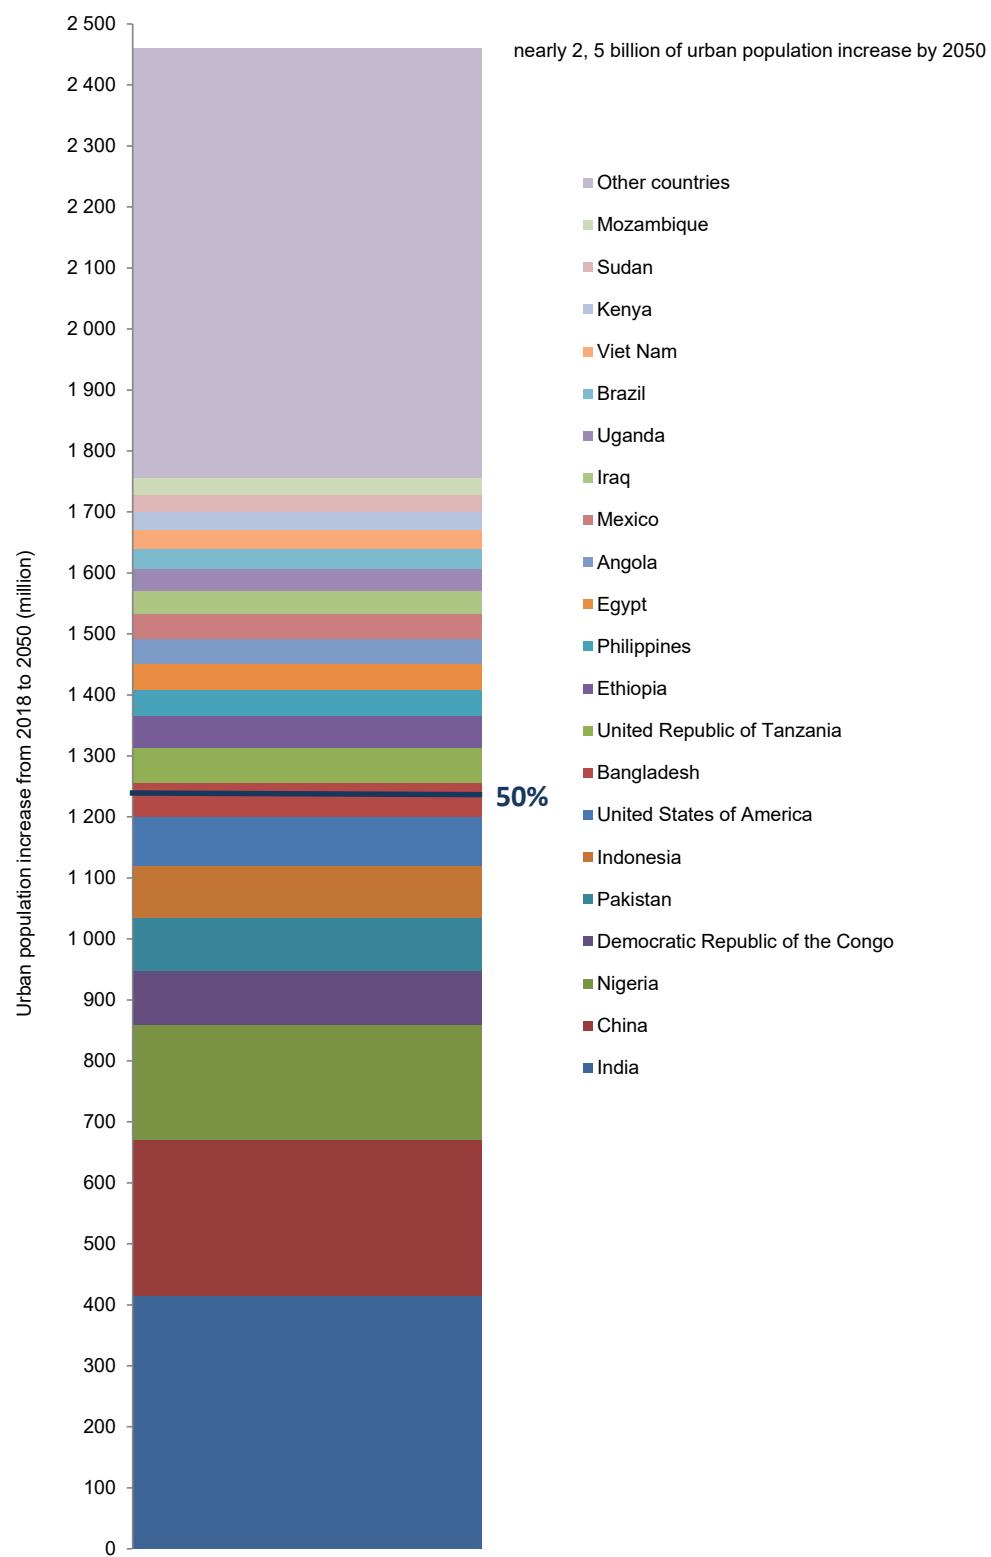

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

**Just a few countries are home to half of the world's urban population.** China has the largest urban population (837 million), followed by India (461 million). These two countries account for 30 per cent of the world's urban population and, with another five countries, the United States of America (269 million), Brazil (183 million), Indonesia (148 million), Japan (117 million) and the Russian Federation (107 million), account for half of the world's urban population.

**Future increases in the world's urban population are expected to be highly concentrated in just a few countries.** Taken together, China, India and Nigeria are projected to account for just over one third of the projected increase of nearly 2.5 billion people in the urban population by 2050 (figure 7). Between 2018 and 2050, the urban areas are expected to grow by 416 million people in India, 255 million in China and 189 million in Nigeria. Five other countries, Bangladesh, the Democratic Republic of Congo, Indonesia, Pakistan and the United States of America, are projected to contribute more than 50 million each to the urban increment. Together, the eight countries will account for half of the total increase in urban population between 2018 and 2050. In a few countries, the urban population will decrease, despite projected increases in the level of urbanization. The largest declines between 2018 and 2050 are projected for Japan, with a decline of 13.5 million in their urban population and for Ukraine, which is expected to see a decline of nearly 2 million urban dwellers.

**The rural population of the world has grown slowly since 1950 and is expected to reach its peak in a few years.** Approximately 3.4 billion people currently live in rural areas around the world. That number is expected to remain relatively constant in the coming years. However, sometime after 2020, the world's rural population will start to decline and is expected to reach about 3.1 billion in 2050. This global trend is driven mostly by the dynamics of rural population change in Africa and Asia, which is home today to nearly 90 per cent of the world's rural population. The majority of the rural population of the world resides in a relatively small number of countries. India has the largest rural population (893 million), followed by China (578 million). Together, these two countries account for nearly 45 per cent of the world's rural population. Bangladesh, Indonesia and Pakistan follow, each with over 100 million rural inhabitants. In Africa, the largest rural populations are located in Nigeria (97 million) and Ethiopia (85 million).

Between 2018 and 2050, the rural population is expected to increase in just over one quarter of the countries of the world. The largest increases will be registered in Ethiopia and Niger (both adding over 30 million rural population), Nigeria and Uganda (both adding just over 25 million). The majority of the countries in the world are expected to have stable or declining rural populations. The largest declines are expected in China, with a decline of 305 million, equivalent to more than one half of their rural population in 2018, and in India, where the number of rural residents is expected to decline by 111 million.

**Figure 7. Increase in the projected urban population between 2018 and 2050 by country**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

Note: The countries identified by name on the chart are those that cumulatively account for 70 per cent of the projected global urban increment between 2018 and 2050.

**Box 2. Sources of urban growth**

Urban growth has three components: natural increase, migration and reclassification. Their respective contributions to urban growth differ depending, *inter alia*, on the demographic changes taking place in a country and the size of a given settlement, on spatial planning policies and national definitions of urban space, and on the physical environment and other country-specific or local circumstances.

**Natural increase** of urban populations results from an excess of births over deaths in urban areas. The balance depends on levels of fertility (affecting the number of births) and life expectancy at birth (affecting the number of deaths), and on the distribution of the population by age (other things being equal, older populations tend to experience fewer births and more deaths). Women living in urban areas typically have greater access to education and modern methods of family planning; as a result, their fertility is often lower compared to that of women living in rural areas. However, despite a lower level of fertility, there is often an excess of births over deaths in urban areas due to a lower level of mortality and a younger age distribution.

**Migration** to cities from rural areas or from abroad contributes to urban growth whenever the number of in-migrants exceeds the number of out-migrants. Migrants are often younger, on average, compared to the populations living in areas of origin or destination. Therefore, migration tends to have an impact on the age distributions of both the sending and receiving populations. Since most migrants to urban areas are adults in the working ages or their children, migrant populations tend to be younger than average. Therefore, migration tends to increase the average age of the population in areas of origin of migration while lowering the average age in areas of destination.

**Reclassification** contributes to urban growth by enlarging the size of urban areas. When cities grow in area, they incorporate neighbouring settlements and their populations, which were formerly classified as rural. Population growth in rural areas may result in reclassification of settlements from rural to urban, thus accelerating the pace of urbanization.

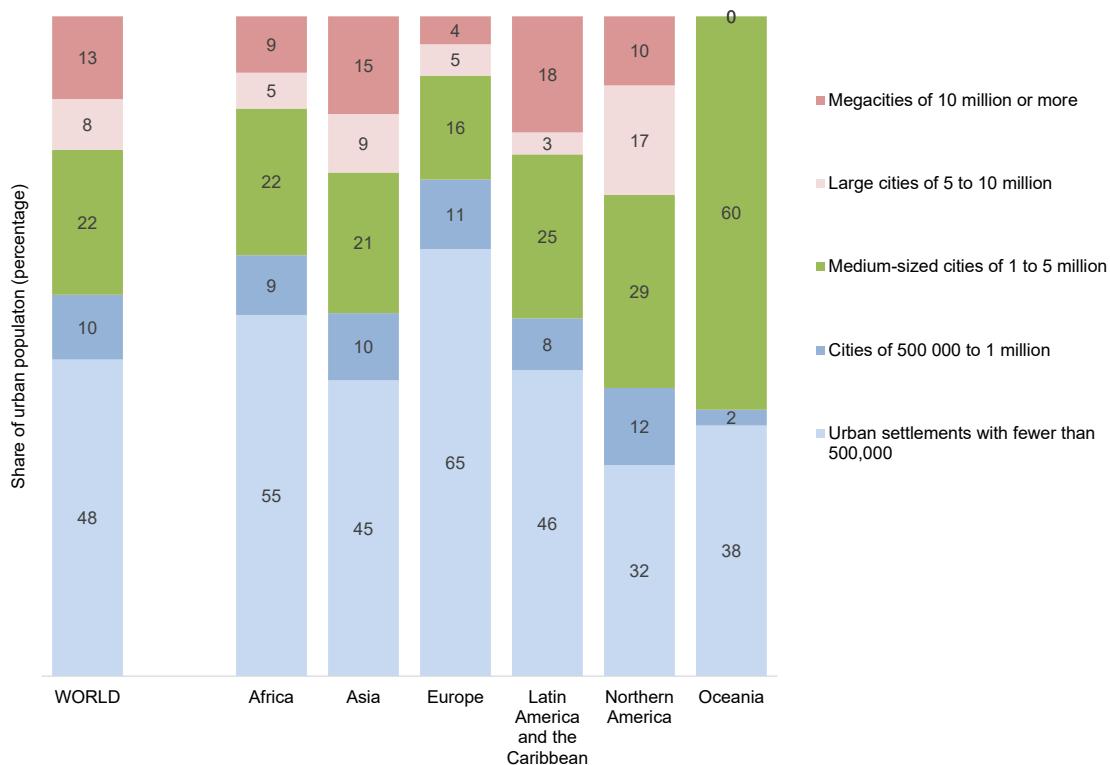

# Cities

Most of the urban population of the world lives in urban settlements with fewer than 1 million inhabitants. In 2018, 2 billion people or close to one half of the world's urban population lives in settlements with fewer than 500,000 inhabitants, and another 400 million or 10 per cent lives in settlements between 500,000 and 1 million, summing up to 58 per cent of the urban population (figure 8 and 9, two bottom bars). While close to 1 billion persons will be added to today's urban population by 2030, more than half of the world's urban dwellers will still be living in urban settlements with fewer than 1 million inhabitants, growing from 2.4 to 2.8 billion people. The number of people living in cities with 500,000 to 1 million inhabitants is expected to grow at a similar pace, increasing from 415 million in 2018 to 494 million in 2030. Compared to larger cities, the urban settlements with fewer than 1 million inhabitants are the most prevalent type in all the geographic

regions of the world except for Oceania, where most urban residents live in larger cities of between 1 and 5 million people.

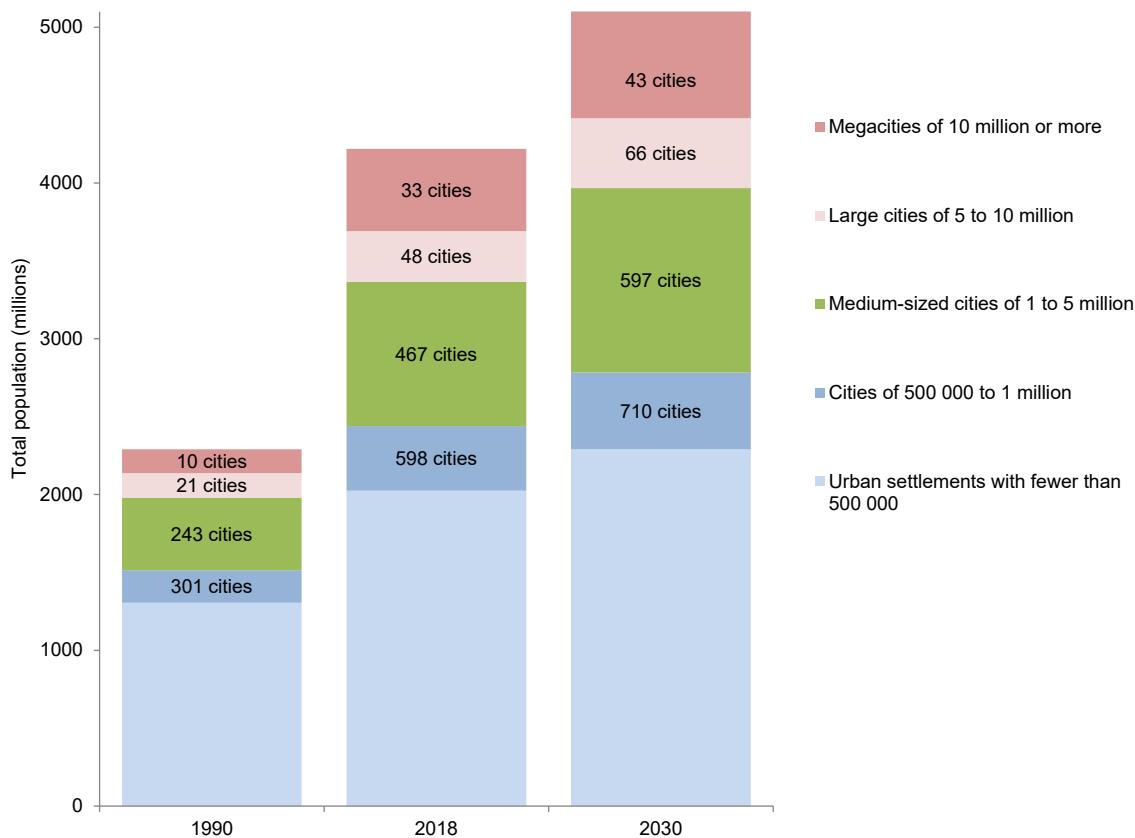

One in five urban dwellers worldwide lives in a medium-sized city with 1 to 5 million inhabitants. While considered medium-sized by global standards, these cities are, in fact, the largest cities in 85 countries or areas. Examples include Australia, with five cities in this category (Sydney, Melbourne, Brisbane, Perth and Adelaide), Italy with four (Rome, Milan, Naples and Turin), Ghana with two (Kumasi and Accra), Morocco with four (Casablanca, Rabat, Fès, and Tanger), and Ukraine with three (Kiev, Kharkiv and Odesa). The global population living in medium-sized cities nearly doubled between 1990 and 2018 and is expected to increase by another 28 per cent between 2018 and 2030, growing from 926 million to 1.2 billion.

### Box 3. Definitions of cities and urban areas\*

Definitions and criteria to delimit cities and urban areas vary across countries.\*\* Population data on urban residence for a given country may include geographic areas that would not fall within the urbanized territory according to standards applied by other countries. For example, the “city proper”, defined by administrative boundaries, may not include suburban areas where a substantial portion of the population working or studying in the central city resides. Furthermore, in some cases, although governed by different local authorities, two or more adjacent cities may form a single urbanized area. For this report two supplementary concepts have been used to improve the comparability of information about city populations across countries and over time. “Urban agglomeration” refers to a contiguous territory inhabited at urban levels of residential density, while “metropolitan area” comprises an urban agglomeration and surrounding areas at a lower settlement density but with strong economic and social linkages to the central city.

\* For additional details, please see United Nations (2018a).

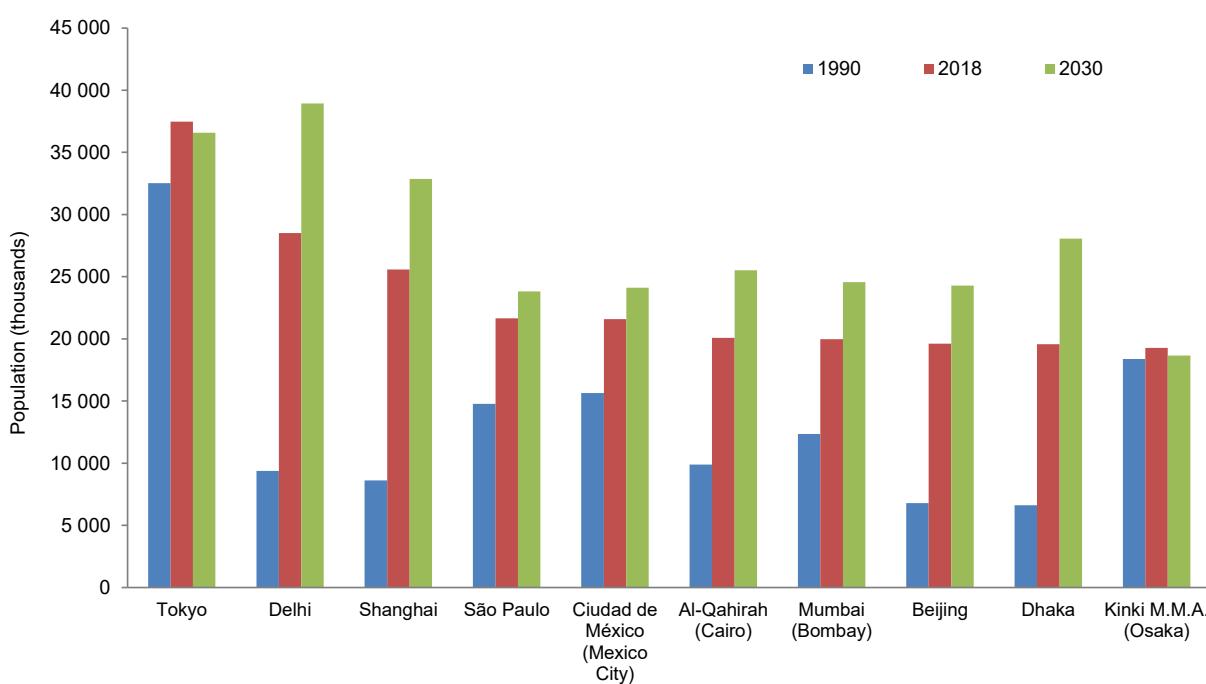

\*\* In the analytical parts of this report the expressions “urban areas” and “cities” are used interchangeably.

About 8 per cent of urban dwellers live in large cities of between 5 and 10 million inhabitants, most of which are in Asia. The proportion of the urban population concentrated in large cities in 2018 varies widely across geographic regions, from 0 per cent in Oceania to 10 per cent in Northern America. Although large cities with 5 to 10 million inhabitants account for a small proportion of the global urban population, their number more than doubled, from 21 in 1990 to 48 in 2018, and they host today just over 325 million people. By 2030, the number of large cities is expected to grow to 66 and house almost 450 million people, representing close to 9 per cent of the global urban population.

Megacities are notable for their size and concentration of economic activity though they are home to only about one in eight of the world's urban dwellers. In 1990 there were 10 cities with more than 10 million inhabitants, hosting 153 million people, which represents less than 7 per cent of the global urban population. Today, the number of megacities has tripled to 33, and most of them are in Asia, including 5 that have recently joined the group:

Bangalore, Bangkok, Jakarta, Lahore and Madras. Globally, the population of megacities has grown to 529 million, and they now account for 13 per cent of the world's urban dwellers. Tokyo is the world's largest city with an agglomeration of 37 million inhabitants, followed by Delhi with 29 million, Shanghai with 26 million, São Paulo and Mexico City with 22 million each (figure 10). As they have surpassed the 20 million inhabitants, the largest megacities may also be referred to as "meta" or "hyper" cities. Furthermore, Cairo, Mumbai, Beijing and Dhaka all have close to 20 million inhabitants. By 2020, Tokyo's population is projected to begin to decline and Delhi is projected to become the most populous city in the world in 2028 (data not shown). Dhaka will move up in the position rank, and by 2030 will become the fourth largest city after Delhi, Tokyo and Shanghai. On the other hand, Osaka (Kinki Major Metropolitan Area) and New York-Newark were the world's second and third largest cities in 1990, but by 2030 they are projected to fall in rank to the 15th and 13th positions, respectively (annex table II).

**Figure 10. Population of the world's ten largest urban agglomerations in 2018, with estimates and projections for 1990 and 2030**

Data source: United Nations, Department of Economic and Social Affairs, Population Division (2018a). *World Urbanization Prospects 2018*.

Megacities are concentrated in only 20 countries. China alone has 6 megacities and 10 cities with populations between 5 and 10 million in 2018, and it will add 2 more megacities and 6 more large cities by 2030. India has 5 megacities today, adding 2 more by 2030 (Ahmadabad and Hyderabad). The 2 megacities of Brazil are expected to remain the only megacities in the country, as is the case in Japan, Pakistan, and the United States of America. Cairo, Kinshasa and Lagos are the only megacities in Africa in 2018, but 2 more are expected to emerge by 2030, as Dar es Salaam and Luanda are each projected to grow beyond 10 million inhabitants. The number of large cities with populations between 5 and 10 million in Africa is also expected to increase, from 5 in 2018 to 13 in 2030. In Latin America, Bogotá and Lima have recently reached 10 million, joining the four pre-existing megacities of the region: Buenos Aires, Mexico City, Rio de Janeiro, and São Paulo. In all, 10 more cities are expected to join the group of megacities between 2018 and 2030; 2 in Africa, 7 in Asia, and 1 in Europe.

Some cities have experienced population decline in recent years. Most of these are located in the low-fertility countries of Asia and Europe where overall population sizes are stagnant or declining. Economic contraction and natural disasters have contributed to population losses in some cities as well. A few cities in Japan and the Republic of Korea (for example, Nagasaki and Busan) have experienced population decline between 2000 and 2018. Several cities in European countries such as Poland, Romania, the Russian Federation and Ukraine have lost population since 2000 as well. In addition to low fertility, emigration has also contributed to smaller population sizes in some of these cities. Globally, fewer cities are projected to see their populations decline from today to 2030, as compared to the last two decades.

## Notes

- (a) More developed regions comprise Europe, Northern America, Australia/New Zealand and Japan.
- (b) Less developed regions comprise all regions of Africa, Asia (except Japan), Latin America and the Caribbean plus Melanesia, Micronesia and Polynesia.
- (c) The group of least developed countries, as defined by the United Nations General Assembly in its resolutions (59/209, 59/210, 60/33, 62/97, 64/L.55, 67/L.43, 64/295 and 68/18) included 47 countries in June 2017: 33 in Africa, 9 in Asia, 4 in Oceania and one in Latin America and the Caribbean.
- (d) Other less developed countries comprise the less developed regions excluding the least developed countries.
- (e) The country classification by income level is based on 2016 GNI per capita from the World Bank.
- (f) Sub-Saharan Africa refers to all of Africa except Northern Africa.
- (1) Including Agalega, Rodrigues, and Saint Brandon.
- (2) Including Zanzibar.
- (3) Including Ascension, and Tristan da Cunha.
- (4) For statistical purposes, the data for China do not include Hong Kong and Macao, Special Administrative Regions (SAR) of China.
- (5) As of 1 July 1997, Hong Kong became a Special Administrative Region (SAR) of China.
- (6) As of 20 December 1999, Macao became a Special Administrative Region (SAR) of China.
- (7) The regions Southern Asia and Central Asia are combined into South-Central Asia.
- (8) Including Sabah and Sarawak.
- (9) Including Nagorno-Karabakh.
- (10) Refers to the whole country.
- (11) Including Abkhazia and South Ossetia.
- (12) Including East Jerusalem.
- (13) Including Transnistria.
- (14) Including Crimea.
- (15) Refers to Guernsey, and Jersey.
- (16) Including Åland Islands.
- (17) Including Svalbard and Jan Mayen Islands.
- (18) Refers to the Vatican City State.
- (19) Including Kosovo.
- (20) Including Canary Islands, Ceuta and Melilla.
- (21) The former Yugoslav Republic of Macedonia.
- (22) Refers to Bonaire, Saba and Sint Eustatius.
- (23) Including Saint-Barthélemy and Saint-Martin (French part).
- (24) A dispute exists between the Governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).
- (25) Including Christmas Island, Cocos (Keeling) Islands, and Norfolk Island.

**Table II****Population size and ranking of urban agglomerations with more than 5 million inhabitants as of 1 July 2018**

Urban Agglomeration	Country or area	Population (thousands)			Rank			Average annual rate of change (per cent)

This report presents the highlights of the 2018 Revision of *World Urbanization Prospects*. The dataset of the *World Urbanization Prospects* contains the latest estimates of the urban and rural populations of 233 countries or areas from 1950 to 2018 and projections to 2050, as well as estimates of population size from 1950 to 2018 and projections to 2035 for all urban settlements with 300,000 inhabitants or more in 2018. The annex tables in these Highlights provide data on the estimated and projected urban and rural populations, the percentage of the population that lives in urban areas and the average annual rate of change of the percentage urban for 233 countries or areas of the world. The tables also show the rank and annual growth rate of urban agglomerations with 5 million inhabitants or more in 2018, while focussing on the time-frame 1990-2030.
